ARSYAD RIANDA PUTRA

FULL-STACK DEVELOPER

Bandung, Indonesia | riandaarsyad@gmail.com | +62-888-0235-5770

PROFESSIONAL SUMMARY

Early-career Full-Stack Developer who designs, builds, and deploys secure, production-ready web and cross-platform applications. Skilled in Flet, FastAPI, PostgreSQL, JWT authentication, and VPS deployment with Nginx and HTTPS, with a focus on end-to-end delivery from interface to database. Delivered a multi-branch financial management system for a retail client, including schema design, PDF exports, and branch-level access control, and is now preparing Android tablet deployment. Strong in production debugging and client collaboration, shown by resolving a critical account-lockout bug and shipping iterative improvements quickly, backed by a customer-facing technical support background.

AREAS OF EXPERTISE

- Frontend & Cross-Platform Development (Flet)
- Backend Development (Python, FastAPI)
- Database Management (PostgreSQL)
- Authentication & Security (JWT, Access Control)
- Deployment & DevOps (VPS, Nginx, Certbot)
- Networking & Troubleshooting
- Technical Support & Client Communication
- Game Development (C# — game jam project)

ACCOMPLISHMENTS

- Secured MetroSnack by replacing a direct client-to-database connection with a three-tier architecture (Flet → FastAPI → PostgreSQL), eliminating credential exposure and enforcing API-level access control
- Resolved a production account-lockout bug that was silently swallowing errors, introducing structured HTTP 423 responses with unlock timestamps so failures are easier to debug and users recover faster
- Delivered 6 rounds of client-requested revisions on a live, multi-branch financial system, including a real-time debt dashboard, color-coded debt statuses, and simpler navigation
- Took the backend from development to production on a VPS, using an Nginx reverse proxy, Certbot HTTPS, and firewall rules that close direct access to the application port
- Extended the PostgreSQL schema with generated columns and a confirmed debt-balance formula, plus 5 new tables for daily income/expense tracking, driver/assistant logs, and vehicle operations across branches
- Built multi-level PDF export (per invoice, monthly folder, and branch) with in-memory buffers integrated into the client's file picker
- Currently preparing Android APK deployment for field tablets (SDK configured; dependency optimization in progress)
- Completed and submitted a full C# game as a participant in the GameSEED 2025 game jam within the competition time limit
- Maintain a public GitHub portfolio of 28+ repositories in Python, TypeScript, PHP, C#, and Java, reflecting continuous self-directed learning

PROFESSIONAL EXPERIENCE

Technical Support, PT. Awan Data Indonesia **Aug 2024 to Nov 2024**

- Resolved network, software, and hardware issues for B2B and B2C customers via WhatsApp and Telegram, adapting each explanation to the customer's technical literacy
- Triaged and prioritized incoming cases and escalated complex ones to teammates, keeping support threads moving and reducing resolution delays
- Translated technical problems into clear, non-technical language so customers understood the fix and the next steps

Full-Stack Developer (Freelance) **Jul 2026 to Sep 2026**

Designed and developed a multi-branch financial management system for a retail business, covering invoicing, daily transactions, debt tracking, and operational finances across multiple store locations.

- Designed a secure three-tier architecture (Flet client → FastAPI backend → PostgreSQL database) to replace an insecure direct client-to-database connection and remove a critical credential-exposure risk
- Implemented JWT authentication and branch-level access control (assert_cabang_access) so each user can access only their assigned branch's data
- Configured and hardened the VPS deployment with an Nginx reverse proxy, Certbot HTTPS, and firewall rules that block direct access to the application port
- Modeled PostgreSQL schema improvements, including generated columns and a confirmed debt-balance formula, and added 5 tables for income/expense tracking, driver/assistant logs, and vehicle operations

- Developed multi-level PDF export (per invoice, monthly folder, and branch) using in-memory buffers integrated with the client's file picker
- Debugged a production account-lockout bug by replacing silent failures with structured HTTP 423 responses and unlock timestamps
- Shipped 6 rounds of client-requested revisions, including a real-time debt dashboard, color-coded status indicators, and simplified navigation

Tech stack: Python, Flet, FastAPI, PostgreSQL, JWT, Nginx, Certbot, psycopg2

EDUCATION

Universitas Pasundan, Bandung **2023 to Present**

Bachelor of Informatics Engineering

TECHNICAL PROFICIENCIES

Programming Languages:	Python, TypeScript, JavaScript, PHP, C#, Go, SQL
Frameworks & Libraries:	FastAPI, Flet, React, Laravel (Blade)
Tools & Platforms:	Git/GitHub, VPS (Linux Server), Nginx, Certbot (SSL/TLS), Vercel, Mikrotik RouterOS
Concepts & Practices:	RESTful API Design, JWT Authentication, Role/Branch-Based Access Control, Three-Tier Architecture, Cross-Platform App Deployment
